Profit Trend Analysis

- While there's an overall upward trend from April to June and a huge spike in August, the volatility with the July drop raises concerns about the consistency and predictability of profit.
- However, the drop in July and the spike in August is attributed to the methodology used in profit calculation
- The difference in value of monthly repayments to the loans disbursed in July is minimal, resulting in lower profit.
- In August, the difference is significantly larger, despite the low volume of transactions. This creates the appearance of a sharp profit increase
